

Apify

Do it once. Never do it again.

Apify learns a task you do in your browser, then does it for you whenever you ask.

What Apify is

If you do something in your browser more than once, you should only have to do it once.

Most people repeat the same work online every week. Looking up hotel prices. Searching for flights. Filling in the same form with slightly different answers. It is slow, it is boring, and nothing about it is hard — it is just the same clicks over and over.

Apify sits in your browser and watches you do that job one time. It remembers every click and every box you filled in. It also works out which answers are the ones that change each time, like the city, the date, or the number of people.

After that, you never do the job again. Apify shows you a short form with only those changing answers on it. You fill in the new details, press run, and Apify goes and does the whole task for you. It opens the website, clicks through it, collects the results, and gives them back to you in a neat list.

It runs on our computers, not yours. So you can close your laptop and it keeps going.

How you use it

Four steps. The first one you do once. The last one you do every time after that.

Step 1	Show it	Press record, then do the job the normal way. Apify watches quietly in the background. You do not have to do anything differently, and you can move between websites if the job needs it.
Step 2	It builds a form	Press stop and your dashboard opens. Apify has already turned what you did into a simple form, with plain names on each box so you can tell what they are.

Step 3 Tidy it up

Websites hide a lot of clutter, so a few odd boxes may show up. Delete the ones you do not want, turn choices into simple tick boxes, or just type what you want changed in your own words.

Step 4 Run it

Type in your new details and press run. You get your results back as a clean list. From now on, this is the only step you ever do.

Part 3

What it can fill in for you

Websites do not only use plain typing boxes. A date picker works differently from a dropdown, and a plus-minus counter works differently again. Apify works out which kind each one is, so it can use them properly instead of guessing.

KIND OF BOX	WHAT THAT MEANS
Typing boxes	Anywhere you type words, like a city or a name.
Dropdown lists	A list you open and pick one option from.
Date pickers	Calendars you click a day on.
Tick boxes	Things you switch on or off, like "free breakfast".
Counters	Plus and minus buttons, like the number of guests.
Hidden extras	Boxes that only appear after you use another one. Adding a child can bring up a box asking their age.

Websites also change their layout from time to time. When that happens Apify tries several ways of finding the box again on its own, and only asks its AI for help if all of them fail.

Part 4

What you can do with it

Recording a job

More than one website	A single job can move across several sites, not just one.
See it as you go	While recording, you can watch the count of steps and boxes going up.
Straight to your dashboard	When you press stop, your dashboard opens with the recording already loaded. Nothing to copy or paste.

Tidying the form

Delete a box	Hides it from view but still uses what you first typed, so the search keeps working properly.
Turn choices into ticks	Apify finds the on-and-off choices and makes them tick boxes. Untick one and it is left out of the search.
Just say what you want	Type something like "make the star rating a tick box" and it does it, or tells you why it cannot.
Look for missed boxes	Checks the website again in case the recording missed something.
Nothing is permanent	Every change can be undone. Your original recording is never touched.

Running a job

Runs on our computers	Your own machine stays free. Close the tab if you like.
Pop-ups handled	Cookie messages and other interruptions are closed automatically.
Tidy results	You get a clean list you can read or pass on, not a messy web page.
You choose how many	Ask for 5 results or 50. You pay a little more for more.
Watch it work	You can see what stage it is at instead of staring at a loading circle.

If something comes out wrong

Tell it what is wrong	Say it in your own words. Apify has another go and shows you the corrected version first, so nothing is saved until you are happy.
-----------------------	--

It remembers	Once you say the new version looks right, every future run of that job is corrected the same way.
Your account	
Simple sign in	Email and password only. Nothing else to fill in.
Your work is safe	If you record something before signing in, it is kept for you and is still there afterwards.
Balance and plan	Both are shown in your account menu, so you always know where you stand.
For developers	Every job also works as a web address your own software can call, if you want that.

Part 5

Prices

You pay monthly, in taka, and you can stop any time. Payment goes through dCash, and cards and bank transfer also work.

PLAN	PER MONTH	WHAT YOU GET
Free	Tk 0	Build up to 5 jobs a day. Good for trying it out.
Builder	Tk 1,500	Build up to 30 jobs a day. Run your saved jobs as often as you like. Faster help when you need it.
Pro	Tk 3,500	Build and run as much as you want. Sell your jobs to other people at a lower fee. First to get new features.
Enterprise	Ask us	Everything in Pro, plus accounts for your whole team, your own support contact, and billing set up to suit you.

What each run costs

HOW THE PRICE IS WORKED OUT

On top of your plan, each job has a small price per run. It is worked out when you build the job, and it never changes on its own.

Two things decide it: how long the job is, and how many results you ask for. A short job asking for a few results is cheap. A long job asking for fifty results costs more, because it takes our computers longer.

The smallest price is Tk 10. A normal job asking for ten results usually comes to around Tk 35. Prices are always round numbers, and you can check the price before you run anything.

Part 6

Not ready yet

These are planned and designed, but not built. They are listed here so nobody expects them today.

- The marketplace. Selling your jobs to other people and earning from each run they do. This is mentioned on the Pro plan, but the shop itself is still being built.
- Staying signed in. Letting a job stay logged in to a website that needs an account.
- Passing answers along. Taking the result from one website and typing it into the next one, inside the same job.
- Team accounts. Sharing jobs with everyone at your company.

One thing to sort out. Our internal notes describe the plans as a monthly pool of runs. The prices page sells them as a daily build limit. This document follows the prices page, because that is what customers actually see. The two need to be made to match before prices change again.
